Chapter 1

ZlibValidation

1.1 Description

Command line tool to validate standard cell libraries in .lib format.

1.2 Usage

```
ZlibValidation
Usage: ./zlibvalidation [OPTIONS] [SUBCOMMAND]

Options:
  -h,--help          Print this help message and exit
  -v,--version        Display program version information and exit

Subcommands:
  parse              Parse the Liberty file and write JSON to a file
  mono              Check the monotonicity of timing arc values
  compare            Compare the comparison library against the reference library and report
                    differences
  supercell         Generate supercells for the given Liberty file
  zlibboost         ZlibBoost - Multi-threaded Library Processing Tool
  clear             Clear the log, JSON, map, markdown files in this directory
  verilog           Generate Verilog file for given Liberty file
  spice            Generate SPICE file for given Liberty file
  func             Check functional equivalence of two Liberty files or Verilog files
```

1.3 Development Diary

1.3.1 2025-01-27

Private Member Functions

- void `read` ()
Reads the Liberty file specified by the `filename_` member variable.
- bool `checkTimingArcMonotonicity` (const `json` &cell, const `json` &pin, const `json` &arc, const std::string &type, bool is_slew)
Checks if the values in a timing arc are monotonically increasing.

Private Attributes

- `si2drErrorT` `err_`
- int `process_` = 0
- float `voltage_` = 0.0
- int `temperature_` = 0

5.7.1 Detailed Description

Definition at line 13 of file `lib_file.hpp`.

5.7.2 Constructor & Destructor Documentation

5.7.2.1 LibFile()

```
LibFile::LibFile (
    const std::string & filepath,
    const std::string & loggername )
```

Constructs a `LibFile` object with specified file path and logger name.

This constructor initializes a `LibFile` object with the given file path and creates a logger with the specified name. It sets up:

- Two logging sinks: a colored console sink and a file sink
- File path information including filename, basename, and a corresponding JSON filename
- Log levels (info for console, debug for file)

Parameters

<code>filepath</code>	The path to the file to be processed
<code>loggername</code>	The name for the logger and the log file

Definition at line 28 of file `lib_file.cpp`.

5.7.2.2 ~LibFile()

```
LibFile::~~LibFile ( )
```

Definition at line 48 of file [lib_file.cpp](#).

5.7.3 Member Function Documentation

5.7.3.1 checkTimingArcMonotonicity()

```
bool LibFile::checkTimingArcMonotonicity (
    const json & cell,
    const json & pin,
    const json & arc,
    const std::string & timing_arc_name,
    bool is_slew ) [private]
```

Checks if the values in a timing arc are monotonically increasing.

This function examines the values in the specified timing arc to ensure they are monotonically increasing. It checks monotonicity in two dimensions:

1. Across rows (by output load capacitance)
2. Across columns (by input slew, only if `is_slew` is true)

The function logs detailed information about any non-monotonic values found, including cell name, pin names, and conditional statements (when clause) if present.

Parameters

<i>cell</i>	The JSON object representing the cell being checked
<i>pin</i>	The JSON object representing the pin being checked
<i>arc</i>	The JSON object representing the timing arc being checked
<i>timing_arc_name</i>	The name of the timing arc to check (e.g., "cell_rise", "cell_fall")
<i>is_slew</i>	Boolean flag indicating whether to check monotonicity across input slew values

Returns

true if all values in the timing arc are monotonic, false otherwise

Exceptions

<i>None, but</i>	logs errors or warnings for invalid data formats or non-monotonic values
------------------	--

Definition at line 219 of file [lib_file.cpp](#).

Here is the caller graph for this function:

5.7.3.2 modify()

```
void LibFile::modify ( )
```

Definition at line 196 of file [lib_file.cpp](#).

5.7.3.3 mono()

```
void LibFile::mono (
    const bool is_slew )
```

Validates that lookup tables are monotonically increasing with respect to the output load.

This function checks the following timing data in the current library to ensure monotonicity:

- cell_rise and retaining_rise
- cell_fall and retaining_fall
- rise_transition and retain_rise_slew
- fall_transition and retain_fall_slew
- min_pulse_width constraints (rise_constraint, fall_constraint)

The function first checks if a parsed JSON representation exists. If not, it parses the Liberty file and creates the JSON file. It then evaluates each timing arc in all cells and reports the pass/fail status at the end.

Parameters

<i>is_slew</i>	Boolean flag indicating whether to check slew values rather than delay values
----------------	---

The function outputs:

- Number of cells that passed/failed the monotonicity check
- List of cells that failed the check (if any)

Definition at line 340 of file [lib_file.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

5.7.3.4 parse()

```
void LibFile::parse ( )
```

Parses the Liberty file and extracts library information into a JSON structure.

This method handles the parsing of a Liberty file by:

1. Initializing the SI2 parser interface error handler
2. Reading the Liberty file contents
3. Extracting the library name
4. Processing second-level groups including:
 - Cell definitions, which are added to the JSON structure
 - Operating conditions, extracting PVT (Process, Voltage, Temperature) values

The parsed data is stored in the `lib_json_` member variable, with the following structure:

- "library_name": Name of the library
- "cells": Array of cell definitions
- "process": Process value
- "voltage": Voltage value (rounded to 2 decimal places)
- "temperature": Temperature value

Note

This method creates local scopes to ensure proper cleanup of SI2 iterators.

Definition at line 130 of file `lib_file.cpp`.

Here is the call graph for this function: Here is the caller graph for this function:

5.7.3.5 read()

```
void LibFile::read ( ) [private]
```

Reads the Liberty file specified by the `filename_` member variable.

This function attempts to read a Liberty file and logs the process. It measures the time taken to read the file and logs any errors encountered during the read operation. If an error occurs, the function logs the error and terminates the program.

- Logs the start of the read operation.
- Measures the duration of the read operation.
- Checks for specific errors (invalid name or syntax error) and logs them.
- Terminates the program with specific exit codes if errors are detected.
- Logs the completion of the read operation and the time taken.

Note

This function uses the `spdlog` library for logging and the `si2drReadLibertyFile` function for reading the Liberty file.

Exceptions

<i>This</i>	function will terminate the program with exit codes 301 or 401 if specific errors are encountered.
-------------	--

    const int chain_length,
    const std::vector< std::string > & cell_names )
```

Definition at line 578 of file [lib_file.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

5.7.3.8 writeJsonToFile()

```
void LibFile::writeJsonToFile ( )
```

Writes the JSON data stored in the `lib_json_` member to a file.

This function attempts to open the specified file for writing. If the file cannot be opened, an error message is logged. If the file is successfully opened, the JSON data is written to the file with an indentation of 2 spaces. After writing, the file is closed and a success message is logged.

Parameters

<i>jsonname</i> ↔	The name of the file to which the JSON data will be written.
—

- [json](#) [comp_json_](#)
- double [reitol_](#)
- double [abstol_](#)

5.9.1 Detailed Description

Definition at line 12 of file [compare.hpp](#).

5.9.2 Constructor & Destructor Documentation

5.9.2.1 LibraryComparator()

```
LibraryComparator::LibraryComparator (
    LibFile & ref_libfile,
    LibFile & comp_libfile,
    double reltol,
    double abstol )
```

Constructs a [LibraryComparator](#) object.

This constructor initializes a [LibraryComparator](#) object by loading and parsing JSON files associated with the provided reference and comparison library files. If the JSON files do not exist, they are generated by parsing the library files.

Parameters

<i>ref_libfile</i>	Reference to the reference library file object.
<i>comp_libfile</i>	Reference to the comparison library file object.
<i>reltol</i>	Relative tolerance value for comparison.

Definition at line 23 of file [compare.cpp](#).

Here is the call graph for this function:

5.9.3 Member Function Documentation

5.9.3.1 compareCell()

```
void LibraryComparator::compareCell (
    const std::string & cell_name,
    const json & ref_cell,
    const json & comp_cell,
    Table & table ) [private]
```

Compares the output pins of a cell between a reference JSON and a comparison JSON.

This function iterates through the output pins of the comparison cell and checks if each pin exists in the reference cell. If a pin is found in both cells, it calls the `comparePin` function to compare the details of the pin. If a pin is not found in the reference cell, a warning is logged. If the comparison cell does not contain any output pins, an informational message is logged.

Parameters

<i>cell_name</i>	The name of the cell being compared.
<i>ref_cell</i>	The reference JSON object containing the cell data.
<i>comp_cell</i>	The comparison JSON object containing the cell data.
<i>table</i>	The table object where the comparison results are stored.

Definition at line 300 of file [compare.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

5.9.3.2 compareLut()

```
void LibraryComparator::compareLut (
    const std::string & cell_name,
    const std::string & pin_name,
    const std::string & timing_type,
    const std::string & related_pin,
    const std::string & arc_name,
    const json & ref_lut,
    const json & comp_lut,
    Table & table ) [private]
```

Compares lookup tables (LUTs) between reference and comparison libraries for a specific timing arc.

This function compares the lookup table values between reference and comparison libraries for a given timing arc, checking the consistency of indices and values. It verifies that the indices match between libraries and then compares each value in the LUT against relative and absolute tolerance thresholds. Any discrepancies that exceed the tolerance limits are recorded in the provided table.

Parameters

<i>cell_name</i>	The name of the cell containing the LUT.
<i>pin_name</i>	The name of the pin associated with the LUT.
<i>timing_type</i>	The timing type of the arc (e.g., "rise_transition", "fall_transition").
<i>related_pin</i>	The related pin for the timing arc.
<i>arc_name</i>	The name of the specific timing arc being compared.
<i>ref_lut</i>	The lookup table from the reference library (in JSON format).
<i>comp_lut</i>	The lookup table from the comparison library (in JSON format).
<i>table</i>	Table object to store comparison results for any mismatches found.

Note

The function logs various information/warning/error messages:

- Logs index mismatches as warnings
- Logs value mismatches as debug messages
- Logs format errors in LUT structure as errors
- Records values exceeding tolerance in the provided table

The comparison uses both relative tolerance (`reltol_`) and absolute tolerance (`abstol_`) to determine if values differ significantly.

Definition at line 99 of file [compare.cpp](#).

Here is the caller graph for this function:

5.9.3.3 comparePin()

```
void LibraryComparator::comparePin (
    const std::string & cell_name,
    const std::string & pin_name,
    const json & ref_pin,
    const json & comp_pin,
    Table & table ) [private]
```

Compares the timing arcs of a given pin between a reference JSON and a comparison JSON.

This function iterates through the timing arcs of the comparison pin and looks for matching timing types in the reference pin. If a matching timing type is found, it calls the compareTimingArc function to compare the timing arcs. If a timing type is not found in the reference JSON, a warning is logged.

Parameters

<i>cell_name</i>	The name of the cell containing the pin.
<i>pin_name</i>	The name of the pin to compare.
<i>ref_pin</i>	The reference JSON object containing the pin's data.
<i>comp_pin</i>	The comparison JSON object containing the pin's data.
<i>table</i>	A reference to a Table object where comparison results are stored.

Definition at line 261 of file [compare.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

5.9.3.4 compareTimingArc()

```
void LibraryComparator::compareTimingArc (
    const std::string & cell_name,
    const std::string & pin_name,
    const std::string & timing_type,
    const json & ref_timing_arc,
    const json & comp_timing_arc,
    Table & table ) [private]
```

Compares a timing arc between two JSON objects.

This function compares a specific timing arc (e.g., cell_rise, cell_fall, rise_transition, fall_transition) between a reference JSON object and a comparison JSON object. It extracts the related pin from the reference timing arc and iterates through a predefined list of arc names. If an arc name is found in the comparison timing arc, it checks if the same arc name exists in the reference timing arc. If both exist, it calls the compareLut function to compare the LUT data associated with the arc. If the arc name is found in the comparison JSON but not in the reference JSON, a warning message is logged.

Parameters

<i>cell_name</i>	The name of the cell.
<i>pin_name</i>	The name of the pin.
<i>timing_type</i>	The type of timing (e.g., "combinational", "sequential").
<i>ref_timing_arc</i>	The reference JSON object containing the timing arc information.
<i>comp_timing_arc</i>	The comparison JSON object containing the timing arc information.
<i>table</i>	The table to store comparison results.

Definition at line 221 of file [compare.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

5.9.3.5 generateReport()

```
void LibraryComparator::generateReport (
    const std::string & output_file )
```

Generates a comparison report between the reference and comparison libraries.

This function generates a detailed comparison report between the reference library and the comparison library. The report includes metadata such as the reference and comparison library paths, absolute and relative tolerances, and the application details. It also includes a legend explaining various symbols used in the report.

The function iterates through each cell in the comparison library, compares it with the corresponding cell in the reference library, and generates a table of differences. If there are any differences, it calculates summary statistics such as the average and maximum differences, and the number of outliers. The results are written to the specified output file in either Markdown or plain text format.

Parameters

<i>output_file</i>	The path to the output file where the report will be written.
--------------------	---

Typedefs

- using [json](#) = nlohmann::json

Functions

- [json generateLutJson](#) (LibGroup &lib_lut_group, si2drErrorT &err)
Generates a JSON object representation of a look-up table (LUT) from a [LibGroup](#) object.
- [json generatePowerJson](#) (LibGroup &lib_power_group, si2drErrorT &err)
Converts a Liberty power group into a JSON representation.
- std::pair< std::string, [json](#) > [generatePinJson](#) (LibGroup &lib_pin_group, si2drErrorT &err)
Generates a JSON representation of a Liberty pin group.
- [json generateCellJson](#) (LibGroup &lib_cell_group, si2drErrorT &err)
Generates a JSON representation of a cell from a [LibGroup](#) object.

6.5.1 Typedef Documentation

6.5.1.1 json

```
using json = nlohmann::json
```

Definition at line 12 of file [json_utils.hpp](#).

6.5.2 Function Documentation

6.5.2.1 generateCellJson()

```
json generateCellJson (
    LibGroup & lib_cell_group,
    si2drErrorT & err )
```

Generates a JSON representation of a cell from a [LibGroup](#) object.

This function processes a [LibGroup](#) representing a cell and converts it into a JSON object. It extracts the cell name and processes specific attributes such as area, cell_leakage_power, and cell_footprint. It also processes pins within the cell by categorizing them based on their direction (input, output, internal, inout).

Parameters

<i>lib_cell_group</i>	The LibGroup object representing the cell
<i>err</i>	Reference to a si2drErrorT object for error handling

Returns

json A JSON object containing the cell's information with the following structure:

- "cell_name": string - name of the cell
- "area": float (optional) - cell area if present
- "cell_leakage_power": float (optional) - cell leakage power if present
- "cell_footprint": string (optional) - cell footprint if present
- "input_pins": array - list of input pins
- "output_pins": array - list of output pins
- "internal_pins": array - list of internal pins
- "inout_pins": array - list of inout pins

Definition at line 272 of file [json_utils.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

6.5.2.2 generateLutJson()

```
json generateLutJson (
    LibGroup & lib_lut_group,
    si2drErrorT & err )
```

Generates a JSON object representation of a look-up table (LUT) from a [LibGroup](#) object.

This function iterates through the attributes of the provided [LibGroup](#) object representing a LUT and converts them into a JSON structure. It specifically handles the following attributes:

- "index_1": Converted to a vector and stored in the JSON
- "index_2": Converted to a vector and stored in the JSON
- "values": Each value is parsed into a vector and added to an array in the JSON

Any other attributes encountered will trigger a warning message.

Parameters

<i>lib_lut_group</i>	The LibGroup object containing the LUT data to be converted
<i>err</i>	Reference to an <code>si2drErrorT</code> object to track any errors during processing

Returns

json A JSON object representing the LUT data with keys for "index_1", "index_2", and "values"

Definition at line 62 of file [json_utils.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

6.5.2.3 generatePinJson()

```
std::pair< std::string, json > generatePinJson (
    LibGroup & lib_pin_group,
    si2drErrorT & err )
```

Generates a JSON representation of a Liberty pin group.

This function traverses a Liberty pin group, extracts relevant attributes and sub-groups, and converts them into a JSON object. It also determines the pin's direction.

Processes the following pin attributes:

- direction
- max_transition, capacitance, rise_capacitance, fall_capacitance, max_capacitance (float types)
- function, power_down_function, related_ground_pin, related_power_pin, three_state (string types)
- clock (boolean type)

Handles the following sub-groups:

- internal_power: Converted using [generatePowerJson\(\)](#)
- timing: Converted using [generateTimingJson\(\)](#)

Parameters

<i>lib_pin_group</i>	The Liberty pin group to process
<i>err</i>	Reference to an error object for tracking Liberty API errors

Returns

A pair containing the pin direction (string) and the JSON representation of the pin

Definition at line 206 of file [json_utils.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

6.5.2.4 generatePowerJson()

```
json generatePowerJson (
    LibGroup & lib_power_group,
    si2drErrorT & err )
```

Converts a Liberty power group into a JSON representation.

This function processes a Liberty power group and converts its attributes and subgroups into a JSON object. It handles attributes like "when", "related_pin", and "related_pg_pin", as well as "rise_power" and "fall_power" subgroups.

Parameters

<i>lib_power_group</i>	The Liberty power group to convert
<i>err</i>	Reference to an si2drErrorT object for error handling

Returns

json A JSON object representing the power group data

The function:

- Extracts string attributes (when, related_pin, related_pg_pin)
- Processes rise_power and fall_power subgroups by converting them to LUT JSON format
- Logs warnings for unknown power subgroup types

Definition at line 154 of file [json_utils.cpp](#).

6.13.1 Macro Definition Documentation

6.13.1.1 LONG_DOUBLE

```
#define LONG_DOUBLE long double
```

Definition at line 609 of file [si2dr_liberty.h](#).

6.13.1.2 SI2_ARGS

```
#define SI2_ARGS(  
    args ) ()
```

Definition at line 34 of file [si2dr_liberty.h](#).

6.13.1.3 SI2_LONG_MAX

```
#define SI2_LONG_MAX 2147483647
```

Definition at line 74 of file [si2dr_liberty.h](#).

6.13.1.4 SI2_LONG_MIN

```
#define SI2_LONG_MIN -2147483647
```

Definition at line 75 of file [si2dr_liberty.h](#).

6.13.1.5 SI2_ULONG_MAX

```
#define SI2_ULONG_MAX 4294967295
```

Definition at line 76 of file [si2dr_liberty.h](#).

6.13.1.6 SI2DR_FALSE

```
#define SI2DR_FALSE SI2\_FALSE
```

Definition at line 96 of file [si2dr_liberty.h](#).

6.13.1.7 SI2DR_MAX_FLOAT32

```
#define SI2DR_MAX_FLOAT32 1E+37
```

Definition at line 87 of file [si2dr_liberty.h](#).

6.13.1.8 SI2DR_MAX_FLOAT64

```
#define SI2DR_MAX_FLOAT64 1.797693e+308
```

Definition at line 89 of file [si2dr_liberty.h](#).

6.13.1.9 SI2DR_MAX_INT32

```
#define SI2DR_MAX_INT32 2147483647
```

Definition at line 91 of file [si2dr_liberty.h](#).

6.13.1.10 SI2DR_MAX_STRING_LEN

```
#define SI2DR_MAX_STRING_LEN 1048576 /*1024*1024*/
```

Definition at line 93 of file [si2dr_liberty.h](#).

6.13.1.11 SI2DR_MIN_FLOAT32

```
#define SI2DR_MIN_FLOAT32 -1E+37
```

Definition at line 86 of file [si2dr_liberty.h](#).

6.13.1.12 SI2DR_MIN_FLOAT64

```
#define SI2DR_MIN_FLOAT64 -1.797693e+308
```

Definition at line 88 of file [si2dr_liberty.h](#).

6.13.1.13 SI2DR_MIN_INT32

```
#define SI2DR_MIN_INT32 -2147483647
```

Definition at line 90 of file [si2dr_liberty.h](#).

6.13.1.14 SI2DR_TRUE

```
#define SI2DR_TRUE SI2_TRUE
```

Definition at line 95 of file [si2dr_liberty.h](#).

6.13.2 Typedef Documentation

6.13.2.1 si2BooleanT

```
typedef enum si2BooleanEnum si2BooleanT
```

6.13.2.2 si2DoubleT

```
typedef double si2DoubleT
```

Definition at line 52 of file [si2dr_liberty.h](#).

6.13.2.3 si2drAttrComplexValIdT

```
typedef si2drObjectIdT si2drAttrComplexValIdT
```

Definition at line 111 of file [si2dr_liberty.h](#).

6.13.2.4 si2drAttrIdT

```
typedef si2drObjectIdT si2drAttrIdT
```

Definition at line 110 of file [si2dr_liberty.h](#).

6.13.2.5 si2drAttrIdT

```
typedef si2drIterIdT si2drAttrIdT
```

Definition at line 116 of file [si2dr_liberty.h](#).

6.13.2.6 si2drAttrTypeT

```
typedef enum si2drAttrTypeT si2drAttrTypeT
```

6.13.2.7 si2drBooleanT

```
typedef si2BooleanT si2drBooleanT
```

Definition at line 98 of file [si2dr_liberty.h](#).

6.13.2.8 si2drDefineIdT

```
typedef si2drObjectIdT si2drDefineIdT
```

Definition at line 112 of file [si2dr_liberty.h](#).

6.13.2.9 si2drDefinesIdT

```
typedef si2drIterIdT si2drDefinesIdT
```

Definition at line 117 of file [si2dr_liberty.h](#).

6.13.2.10 si2drErrorT

```
typedef enum si2drErrorT si2drErrorT
```

6.13.2.11 si2drExprT

```
typedef struct si2drExprT si2drExprT
```

6.13.2.12 si2drExprTypeT

```
typedef enum si2drExprTypeT si2drExprTypeT
```

6.13.2.13 si2drFloat32T

```
typedef si2FloatT si2drFloat32T
```

Definition at line 101 of file [si2dr_liberty.h](#).

6.13.2.14 si2drFloat64T

```
typedef si2DoubleT si2drFloat64T
```

Definition at line 102 of file [si2dr_liberty.h](#).

6.13.2.15 si2drGroupIdT

```
typedef si2drObjectIdT si2drGroupIdT
```

Definition at line 109 of file [si2dr_liberty.h](#).

6.13.2.16 si2drGroupsIdT

```
typedef si2drIterIdT si2drGroupsIdT
```

Definition at line 115 of file [si2dr_liberty.h](#).

6.13.2.17 si2drInt32T

```
typedef si2LongT si2drInt32T
```

Definition at line 100 of file [si2dr_liberty.h](#).

6.13.2.18 si2drIterIdT

```
typedef si2IteratorIdT si2drIterIdT
```

Definition at line 106 of file [si2dr_liberty.h](#).

6.13.2.19 si2drMessageHandlerT

```
typedef si2drVoidT(* si2drMessageHandlerT) (si2drSeverityT sev, si2drErrorT errToPrint, si2drStringT

```
typedef si2drIterIdT si2drValuesIdT
```

Definition at line 119 of file [si2dr_liberty.h](#).

6.13.2.27 si2drValueTypeT

```
typedef enum si2drValueTypeT si2drValueTypeT
```

6.13.2.28 si2drVoidT

```
typedef si2VoidT si2drVoidT
```

Definition at line 104 of file [si2dr_liberty.h](#).

6.13.2.29 si2FloatT

```
typedef float si2FloatT
```

Definition at line 51 of file [si2dr_liberty.h](#).

6.13.2.30 si2IteratorIdT

```
typedef void* si2IteratorIdT
```

Definition at line 83 of file [si2dr_liberty.h](#).

6.13.2.31 si2LongT

```
typedef long int si2LongT
```

Definition at line 50 of file [si2dr_liberty.h](#).

6.13.2.32 si2ObjectIdT

```
typedef struct si2OID si2ObjectIdT
```

6.13.2.33 si2StringT

```
typedef char* si2StringT
```

Definition at line 53 of file [si2dr_liberty.h](#).

6.13.2.34 si2TypeT

```
typedef enum si2TypeEnum si2TypeT
```

6.13.2.35 si2VoidT

```
typedef void si2VoidT
```

Definition at line 54 of file [si2dr_liberty.h](#).

6.13.3 Enumeration Type Documentation

6.13.3.1 si2BooleanEnum

```
enum si2BooleanEnum
```

Enumerator

SI2_FALSE	
SI2_TRUE	

Definition at line 49 of file [si2dr_liberty.h](#).

6.13.3.2 si2drAttrTypeT

enum [si2drAttrTypeT](#)

Enumerator

SI2DR_SIMPLE	
SI2DR_COMPLEX	

Definition at line 139 of file [si2dr_liberty.h](#).

6.13.3.3 si2drErrorT

enum [si2drErrorT](#)

Enumerator

SI2DR_NO_ERROR	
SI2DR_INTERNAL_SYSTEM_ERROR	
SI2DR_INVALID_VALUE	
SI2DR_INVALID_NAME	
SI2DR_INVALID_OBJECTTYPE	
SI2DR_INVALID_ATTRTYPE	
SI2DR_UNUSABLE_OID

Functions

- `std::vector< double > parseStringToVector` (const std::string &str)
Parses a string representation of a vector of doubles into a vector of doubles.
- `json generateLutJson` (LibGroup &lib_lut_group, si2drErrorT &err)
Generates a JSON object representation of a look-up table (LUT) from a [LibGroup](#) object.
- `json generateTimingJson` (LibGroup &lib_timing_group, si2drErrorT &err)
Generates a JSON representation of timing information from a library timing group.
- `json generatePowerJson` (LibGroup &lib_power_group, si2drErrorT &err)
Converts a Liberty power group into a JSON representation.
- `std::pair< std::string, json > generatePinJson` (LibGroup &lib_pin_group, si2drErrorT &err)
Generates a JSON representation of a Liberty pin group.
- `json generateCellJson` (LibGroup &lib_cell_group, si2drErrorT &err)
Generates a JSON representation of a cell from a [LibGroup](#) object.

6.24.1 Function Documentation

6.24.1.1 generateCellJson()

```
json generateCellJson (
    LibGroup & lib_cell_group,
    si2drErrorT & err )
```

Generates a JSON representation of a cell from a [LibGroup](#) object.

This function processes a [LibGroup](#) representing a cell and converts it into a JSON object. It extracts the cell name and processes specific attributes such as area, cell_leakage_power, and cell_footprint. It also processes pins within the cell by categorizing them based on their direction (input, output, internal, inout).

Parameters

<i>lib_cell_group</i>	The LibGroup object representing the cell
<i>err</i>	Reference to a si2drErrorT object for error handling

Returns

json A JSON object containing the cell's information with the following structure:

- "cell_name": string - name of the cell

- "area": float (optional) - cell area if present
- "cell_leakage_power": float (optional) - cell leakage power if present
- "cell_footprint": string (optional) - cell footprint if present
- "input_pins": array - list of input pins
- "output_pins": array - list of output pins
- "internal_pins": array - list of internal pins
- "inout_pins": array - list of inout pins

Definition at line 272 of file [json_utils.cpp](#).

6.24.1.2 generateLutJson()

```
json generateLutJson (
    LibGroup & lib_lut_group,
    si2drErrorT & err )
```

Generates a JSON object representation of a look-up table (LUT) from a [LibGroup](#) object.

This function iterates through the attributes of the provided [LibGroup](#) object representing a LUT and converts them into a JSON structure. It specifically handles the following attributes:

- "index_1": Converted to a vector and stored in the JSON
- "index_2": Converted to a vector and stored in the JSON
- "values": Each value is parsed into a vector and added to an array in the JSON

Any other attributes encountered will trigger a warning message.

Parameters

<i>lib_lut_group</i>	The LibGroup object containing the LUT data to be converted
<i>err</i>	Reference to an si2drErrorT object to track any errors during processing

Returns

json A JSON object representing the LUT data with keys for "index_1", "index_2", and "values"

Definition at line 62 of file [json_utils.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

6.24.1.3 generatePinJson()

```
std::pair< std::string, json > generatePinJson (
    LibGroup & lib_pin_group,
    si2drErrorT & err )
```

Generates a JSON representation of a Liberty pin group.

This function traverses a Liberty pin group, extracts relevant attributes and sub-groups, and converts them into a JSON object. It also determines the pin's direction.

Processes the following pin attributes:

- direction
- max_transition, capacitance, rise_capacitance, fall_capacitance, max_capacitance (float types)
- function, power_down_function, related_ground_pin, related_power_pin, three_state (string types)
- clock (boolean type)

Handles the following sub-groups:

- internal_power: Converted using [generatePowerJson\(\)](#)
- timing: Converted using [generateTimingJson\(\)](#)

Parameters

<i>lib_pin_group</i>	The Liberty pin group to process
<i>err</i>	Reference to an error object for tracking Liberty API errors

Returns

A pair containing the pin direction (string) and the JSON representation of the pin

Definition at line 206 of file [json_utils.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

6.24.1.4 generatePowerJson()

```
json generatePowerJson (
    LibGroup & lib_power_group,
    si2drErrorT & err )
```

Converts a Liberty power group into a JSON representation.

This function processes a Liberty power group and converts its attributes and subgroups into a JSON object. It handles attributes like "when", "related_pin", and "related_pg_pin", as well as "rise_power" and "fall_power" subgroups.

Parameters

<i>lib_power_group</i>	The Liberty power group to convert
<i>err</i>	Reference to an si2drErrorT object for error handling

Returns

json A JSON object representing the power group data

The function:

- Extracts string attributes (when, related_pin, related_pg_pin)
- Processes rise_power and fall_power subgroups by converting them to LUT JSON format
- Logs warnings for unknown power subgroup types

Definition at line 154 of file [json_utils.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

6.24.1.5 generateTimingJson()

```
json generateTimingJson (
    LibGroup & lib_timing_group,
    si2drErrorT & err )
```

Generates a JSON representation of timing information from a library timing group.

This function extracts timing attributes and sub-groups from a Liberty timing group and organizes them into a JSON object. It processes standard timing attributes like 'related_pin', 'timing_type', 'timing_sense', and 'when', as well as timing tables such as 'cell_fall', 'cell_rise', 'fall_transition', 'rise_transition', 'fall_constraint', and 'rise_constraint'.

Parameters

<i>lib_timing_group</i>	The Liberty timing group to process
<i>err</i>	Reference to an si2drErrorT object for error reporting

Returns

json A JSON object containing the extracted timing information

Definition at line 106 of file [json_utils.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

6.24.1.6 parseStringToVector()

```
std::vector< double > parseStringToVector (
    const std::string & str )
```

Parses a string representation of a vector of doubles into a vector of doubles.

This function takes a string containing comma-separated numbers, cleans it by removing backslashes and newline characters, and then converts each comma-separated value into a double that is added to the resulting vector.

Parameters

<i>str</i>	The input string to be parsed, containing comma-separated numbers
------------	---

Returns

`std::vector<double>` A vector of doubles parsed from the input string

Exceptions

<code>std::invalid_argument</code>	If the string contains values that cannot be converted to double
<code>std::out_of_range</code>	If the string contains values that are out of range for double

Definition at line 28 of file `json_utils.cpp`.

Functions

- void [printInfo](#) ()
Sets up and configures the global logger and prints application information.
- void [parseLibFile](#) (const std::string &library_path, const std::string log_file_name)
Parses a library file and generates corresponding output.
- void [monoCheckLibFile](#) (const std::string &library_path, const std::string log_file_name, bool is_slew)
Performs a monotonicity check on a library file.
- void [supercellLibFile](#) (const std::string &library_path, const std::string &log_file_name, int chain_length, const std::vector< std::string > &cell_names)
Creates supercell map structures from a Liberty library file.
- void [verilogLibFile](#) (const std::string &library_path, const std::string &log_file_name, int chain_length, const std::vector< std::string > &cell_names)
Generates Verilog files from a library file for specified cells.
- void [compareLibFiles](#) (const std::string &ref_lib, const std::string &comp_lib, const double reltol, const double abstol, std::string &report_file_name)

Compares two library files and generates a detailed comparison report.

- void [funcLibFile](#) (const std::string &ref_file, const std::string &comp_file, const std::vector< std::string > &cell_names)
- int [main](#) (int argc, char *argv[])

    const double reltol,
    const double abstol,
    std::string & report_file_name )
```

Compares two library files and generates a detailed comparison report.

This function compares a reference library file with another library file, performing validation checks based on specified tolerance parameters. The comparison results are written to a report file in markdown or text format.

Parameters

<i>ref_lib</i>	Path to the reference library file to use as the baseline
<i>comp_lib</i>	Path to the library file to compare against the reference
<i>reltol</i>	Relative tolerance for numerical comparisons (must be ≥ 0.0)
<i>abstol</i>	Absolute tolerance for numerical comparisons
<i>report_file_name</i>	[in,out] Name of the file to write the comparison report to. If empty, defaults to [comp_lib_basename].cmp.md. If provided but doesn't end with .txt or .md, .md will be appended.

Note

The function will log an error and return without comparing if reltol is invalid.

Log files will be created with the naming pattern [library_basename].cmp.log

The function uses the [LibraryComparator](#) class to perform the actual comparison.

6.32.1.4 monoCheckLibFile()

```
void monoCheckLibFile (
    const std::string & library_path,
    const std::string log_file_name,
    bool is_slew )
```

Performs a monotonicity check on a library file.

This function loads a library file and performs monotonicity validation on it. Results are logged to a file. If no log file name is provided, it generates one based on the library file name.

Parameters

<i>library_path</i>	Path to the library file to check
<i>log_file_name</i>	Name of the log file (optional - if empty, generates a name based on library file)
<i>is_slew</i>	Boolean flag indicating whether to check slew monotonicity (true) or other parameters (false)

Exceptions

<i>Any</i>	exceptions from the monotonicity check are caught and logged

6.32.1.5 parseLibFile()

```
void parseLibFile (
    const std::string & library_path,
    const std::string log_file_name )
```

Parses a library file and generates corresponding output.

This function processes the given library file, parsing its contents and generating a JSON output. It also logs the parsing process to a specified log file or creates a default log file if none is provided.

Parameters

<i>library_path</i>	Path to the library file that needs to be parsed
<i>log_file_name</i>	Optional name for the log file. If empty, a default name is generated based on the library filename with ".parse.log" extension

Exceptions

<i>The</i>	function catches and logs any exceptions but doesn't propagate them
------------	---

Definition at line 65 of file [main.cpp](#).

Here is the call graph for this function: Here is the caller graph for this function:

6.32.1.6 printInfo()

```
void printInfo ( )
```

Sets up and configures the global logger and prints application information.

This function performs the following operations:

1. Creates a console sink for logging with level set to INFO
2. Creates a file sink for logging with level set to DEBUG, saving to [APP_NAME].log
3. Configures a logger with both sinks and sets it as the default logger
4. Outputs basic application information:
 - Version and build timestamp
 - Author information
 - Log file location

Note

Uses spdlog library for logging functionality

Depends on APP_NAME, APP_VERSION, BUILD_TIMESTAMP, APP_AUTHOR, and APP_CONTACT macros

Definition at line 34 of file [main.cpp](#).

Here is the caller graph for this function:

6.32.1.7 supercellLibFile()

```
void supercellLibFile (
    const std::string & library_path,
    const std::string & log_file_name,
    int chain_length,
    const std::vector< std::string > & cell_names )
```

Creates supercell map structures from a Liberty library file.

This function reads a Liberty file, creates supercell structures based on the specified chain length and cell names, and logs the process to a file.

Parameters

<i>library_path</i>	Path to the Liberty file to process
<i>log_file_name</i>	Name of the log file (if empty, defaults to "[library_name].supercell.log")
<i>chain_length</i>	The length of chains to create (must be ≥ 1)
<i>cell_names</i>	Vector of cell names to process for supercell generation

Exceptions

<i>May</i>	pass through exceptions from the LibFile::supercell method
------------	--

Note

The function validates the chain length and logs all activities including errors that might occur during processing

6.32.1.8 verilogLibFile()

```
void verilogLibFile (
    const std::string & library_path,
    const std::string & log_file_name,
    int chain_length,
    const std::vector< std::string > & cell_names )
```

Generates Verilog files from a library file for specified cells.

This function processes a library file and generates Verilog representation for the specified cell names with a given chain length. The operation results are logged to a specified or default log file.

Parameters

<i>library_path</i>	Path to the library file to process
<i>log_file_name</i>	Name for the log file (if empty, a default name will be generated)
<i>chain_length</i>	Number of cells to chain together, must be ≥ 1
<i>cell_names</i>	Vector of cell names to generate Verilog for

Exceptions

<i>Catches</i>	any exceptions from the verilog generation process and logs them
